Methods in Pain Research (Frontiers in Neuroscience)

Methods in Pain Research (Frontiers in Neuroscience)

In the past two decades, pain research has become one of the most rapidly growing areas of neuroscience activity. Methods in Pain Research brings together in a single volume a survey of the methods that can be used to study a reaction or 'sensory report' in humans that can only be inferred by indirect means in animal or tissues studies. It presents source material, useful advice, and guidance to specific details as well as examples of current usage.

With each topic presented by one or more of the leading experts in the field, it examines the major modern techniques used in studying pain, including gene linkage, brain imaging methods, the use of transgenic rodent models, painful sensory neuropathy models, and more. The material also covers conventional methods of pain study, such as anatomical and electrophysiological techniques. Methods in Pain Research provides up-to-date methodology and a guide to the strategies of experimental design.
